

FIRST LAW OF GEOGRAPHY

"Everything is related to everything else, but near things are more related than distant things."

-Waldo Tobler

FIRST LAW OF GEOGRAPHY

This might seem obvious:

- Students in the same class interact more.
- Orca pods in different areas develop different dialects.
- Hemlocks in BC are more related to each other than to hemlocks in NB.

FIRST LAW OF GEOGRAPHY

Not a **grantee** of similarity.

- Vancouver's average snowfall is < 30 cm/yr
- Grouse Mountain frequently exceeds 9 m/yr.

SPATIAL HETEROGENEITY

Uneven distribution across space.

BONINI'S PARADOX

As a model of a complex system becomes more complete, it becomes less understandable.

- It will eventually be just as difficult to understand as the real-world processes it represents.
 - **e.g.** a 1:1 scale map
- At a certain point, we have to ignore the heterogeneity.

REVISITING MAP SCALE

Map scale: ratio of map units to real world units.

- Small Scale: Large area, more generalization, less detail.
- Large Scale: Small area, more detail, less generalization.

TIME SCALE

Comparison of Different Time Scales

ANALYSIS SCALE

Different phenomena operate on different temporal and spatial scales.

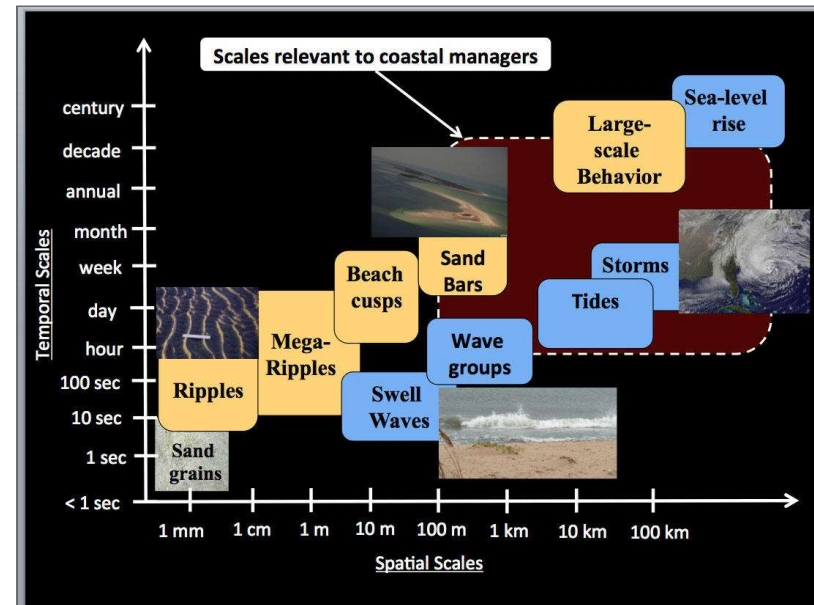

- No need to model tornadoes in a global climate model.
- Impractical to map turbulence globally.

ANALYSIS SCALE

Different phenomena operate on different temporal and spatial scales.

- Identify the scale relevant to your analysis.

SPATIAL AUTOCORRELATION

Positive spatial
autocorrelation

No spatial
autocorrelation

Negative spatial
autocorrelation

Measure of similarity across space.

SPATIAL DATA MODELS

Raster Data: Grid Cells with Attributes

Vector Data: Points, Lines, and Polygons with Attributes

We can exploit spatial autocorrelation to simplify our representation of spatial data.

MAP THE FOREST NOT THE TREES

We don't need the location of every tree to map a forest.

- Use average presence of trees over a larger area.

SIMILARITY ACROSS SPACE

Natural systems usually exhibit degrees of spatial heterogeneity **and** autocorrelation.

- What is heterogeneous at one scale may be **homogeneous** at another.

SPATIAL RESOLUTION

Relates to the level of spatial detail in a dataset.

What is the smallest feature that is included in a dataset?

Spatial Resolution

HIGH

LOW

TEMPORAL RESOLUTION

Relates to the level of temporal detail in a dataset.

Over what time period is the data valid?

Are there multiple observations?

Peak Greenness 2014

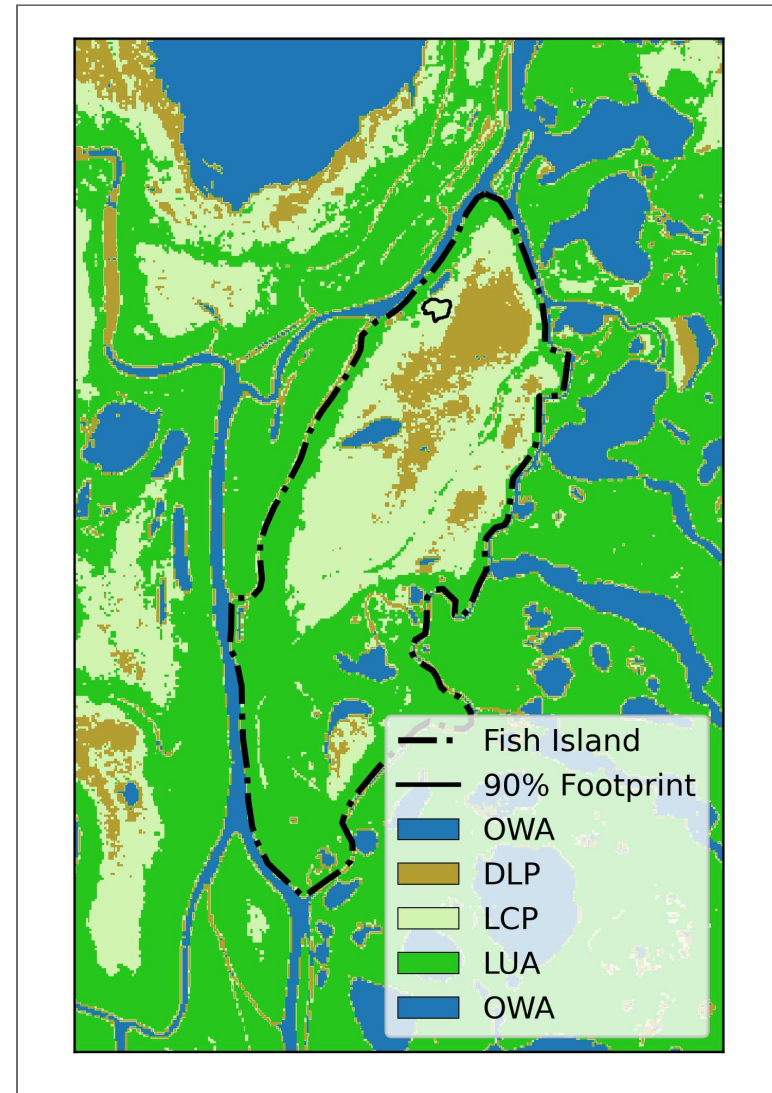

RESOLUTION VS. SCALE

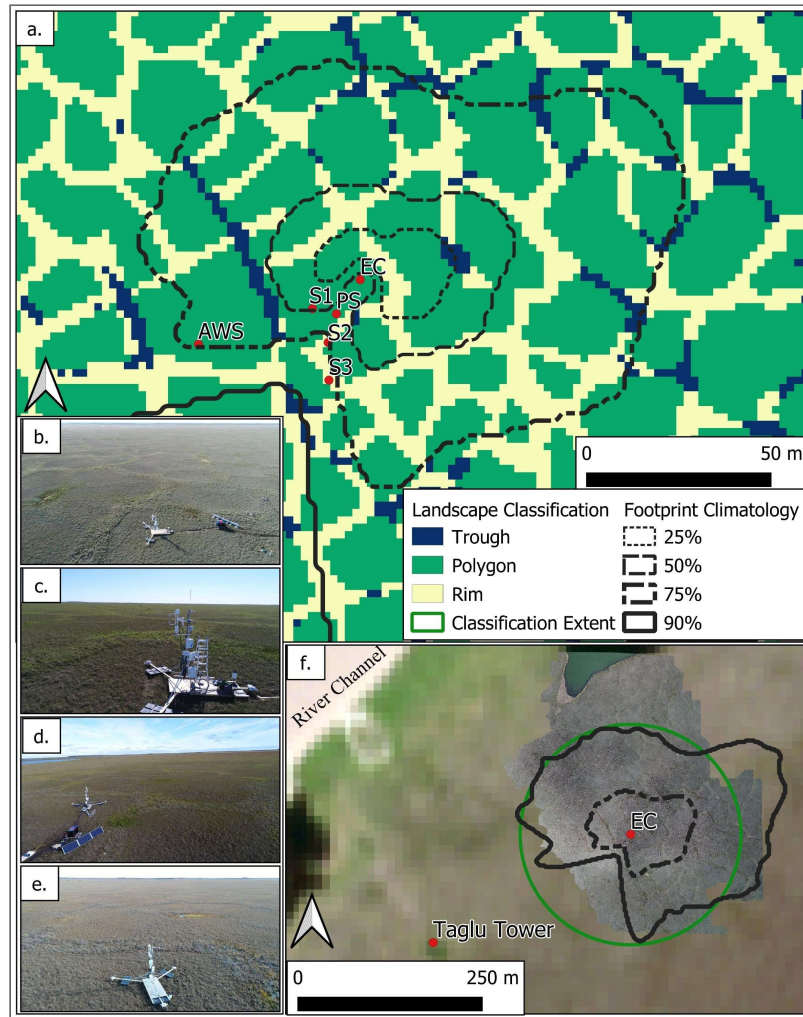

The scale of our analysis dictates our desired resolution.

Data resolution can limit the scale of our analysis.

SCALE DEPENDENCE

SCALE DEPENDENCE

Acknowledge the heterogeneity where appropriate.

- Large scale maps might need more attention to detail.
- Higher resolution data.

SCALE DEPENDENCE

Count on spatial autocorrelation and call a unit homogeneous where appropriate.

- Smaller scale maps can be more generalized.
- Lower resolution data.
